ADB Economics Working Paper No. 699

October 2023

### A.1 Stochastic Frontier Analysis

The production function of the  $i^{th}$  firm takes the form of  $Y_i = f(x_i, \beta)$  where  $Y_i$  is the output,  $x_i$  is a vector of inputs, and  $\beta$  is the vector of technology parameters. However, inefficiencies (i.e., real output is less than the potential output) and random shocks  $v_i$  affect production functions.  $Y_i$  now becomes

$$y_i = f(x_i, \beta)\psi_i \exp(v_i) \quad (\text{A.1})$$

where  $\psi_i$  is the degree of efficiency of the  $i^{th}$  firm. In equation (A.1), the output is assumed to be strictly positive  $y_i > 0$ . That is, firms should produce output using the given inputs and technology. Therefore,  $\psi_i$  is also assumed to be strictly positive and must be bounded by  $(0,1]$ . This implies that if  $\psi_i = 1$ , then the firm is producing the maximum output using the inputs and technology embodied in the production function  $f(x_i, \beta)$ ; and if  $\psi_i < 1$ , then the firm is not optimizing the use of inputs and technology.

Taking the natural logarithm of equation (A.1) and defining  $\ln(\psi_i) = -v_i$  as the level of inefficiency yields

$$\ln(y_i) = \beta_0 + \sum_{c=1}^k \beta_c \ln(x_{c,i}) + v_i - v_i \quad (\text{A.2})$$

where  $v_i$  is the idiosyncratic error, and  $v_i$  is the inefficiency. Note that  $v_i$  must be greater than or equal to zero to satisfy the restrictions imposed on equation (A.1).  $v_i$  and  $v_i$  are distributed independently of each other and of the covariates in equation (A.2). Moreover,  $v_i$  and  $v_i$  are assumed to be independently and identically distributed (iid) and follow the normal distribution (truncated at zero, in the case of  $v_i$ ) with mean  $\mu$  and variance  $\sigma^2$ .

$$v_i \sim N^+(\mu, \sigma_v^2) \quad (\text{A.3})$$

$$v_i \sim N(\mu, \sigma_v^2) \quad (\text{A.4})$$

Following equation (A.2), we estimate the following econometric model:<sup>1</sup>

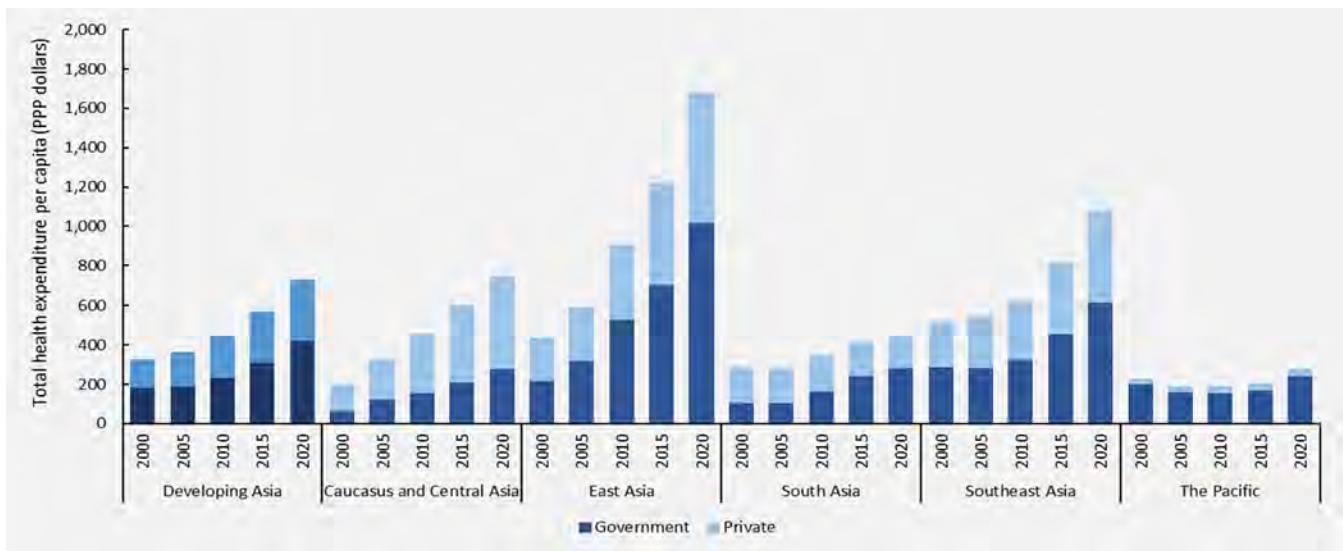

$$\ln(LE_i) = \beta_0 + \beta_1 \ln(HE_i) + \beta_2 \ln(EducSh_i) + \beta_3 \ln(PopDens_i) + \beta_4 \ln(Sani_i) + \beta_5 \ln(Drink_i) + \beta_6 \ln(Tob_i) + \beta_7 \ln(TB_i) + \beta_8 \ln(HIV_i) + v_i - u_i \quad (\text{A.5})$$

where  $LE$  is the life expectancy at birth that serves as the output in the model.  $HE$  refers to the total and government health expenditures per capita. We also control for other variables such as socioeconomic demographics, use of tobacco, and incidence/prevalence of communicable diseases.  $Educ$  is the share of primary school enrolment;  $PopDens$  is the population density;  $Sani$  and  $Drink$  are the share of population using at least basic sanitation services and using at least basic drinking water services, respectively;  $Tob$  is the prevalence of current tobacco use;  $TB$  is the incidence of tuberculosis per 100,000 people; and  $HIV$  is the prevalence of human immunodeficiency virus, total (% of population ages 15–49). Appendix Table A.2 has the complete description and sources of data.

---

<sup>1</sup> The estimation command in Stata is **sfcross**.

**Figure A.1** Total health expenditure per capita (PPP dollars), selected years

PPP = purchasing power parity.

Notes: The global sample covers 168 economies, comprising 37 Developing Asian economies—Caucasus and Central Asia has 7, East Asia 3, South Asia 7, Southeast Asia 10, and the Pacific 10. Total health expenditure per capita are 2017 real values.

**Table A.1** Summary of differences between DEA and SFA

<b>Consideration</b>	<b>Data Envelopment Analysis</b>	<b>Stochastic Frontier Analysis</b>
Number of outputs	Accommodates multiple inputs and multiple outputs (measured in different units)	Using multiple outputs require aggregation into a single measure
Production function	Requires less restrictive assumptions on functional form	Imposes certain functional form of production function
Sample size	Less sensitive to small sample size	Sensitive to small sample size
Heterogenous units	Sensitive to variation	Allows number of control variables to account for variation
Outliers	Sensitive, defines the frontiers	Not sensitive
Statistical noise	Not accounted for, presumed part of inefficiency	Accounts for randomness and measurement errors, which are distinguished from measure of inefficiency

DEA = data envelopment analysis, SFA = stochastic frontier analysis.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
<b>Data Envelopment Analysis</b>			
Life expectancy at birth, total (years)		Life expectancy at birth indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.	World Bank. World Development Indicators. <a href="https://databank.worldbank.org/source/world-development-indicators">https://databank.worldbank.org/source/world-development-indicators</a> .
Domestic private health expenditure per capita, PPP (current international \$)		Current private expenditures on health per capita expressed in international dollars at purchasing power parity (PPP).	World Bank.
Domestic general government health expenditure per capita, PPP (current international dollars)		Public expenditure on health from domestic sources per capita expressed in international dollars at purchasing power parity.	World Bank.
Total health expenditure per capita, PPP (current international \$)		Derived as the sum of domestic private health expenditure per capita and domestic general government health expenditure per capita.	Authors' calculations.
Current health expenditure per capita, PPP (current international \$)		Derived as the sum of total health expenditure per capita and external health expenditure per capita.	Authors' calculations.
Tuberculosis treatment success rate (% of new cases)		Tuberculosis treatment success rate is the percentage of all new tuberculosis cases (or new and relapse cases for some countries) registered under a national tuberculosis control program in a given year that successfully completed treatment, with or without bacteriological evidence of success ("cured" and "treatment completed" respectively).	World Bank.
Infant survival rate, $ISR = \frac{(1,000 - IMR)}{IMR}$ where $IMR$ is the infant mortality rate per 1,000 live births		Ratio of infants that survived to infants that died.	Authors' calculations. Basic data of infant mortality rate is from the World Bank.
Neonatal survival rate, $NSR = \frac{(1,000 - NMR)}{NMR}$ where $NMR$ is the neonatal mortality rate per 1,000 live births		Ratio of neonates that survived to neonates that died.	Authors' calculations. Basic data of neonatal mortality rate is from the World Bank.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
	Under-five children survival rate, $USR = \frac{(1,000 - UMR)}{UMR}$ where $UMR$ is the under-five mortality rate per 1,000 live births	Ratio of under-five children that survived to under-five children that died.	Authors' calculations. Basic data of under-five mortality rate is from the World Bank.
<b>Stochastic Frontier Analysis</b>			
<i>LE</i>	Life expectancy at birth (years)	Life expectancy at birth indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.	World Bank.
<i>HEPub</i>	Domestic general government health expenditure per capita, PPP (current international dollars)	Public expenditure on health from domestic sources per capita expressed in international dollars at purchasing power parity.	World Bank.
<i>HEPriv</i>	Domestic private health expenditure per capita, PPP (current international dollars)	Current private expenditures on health per capita expressed in international dollars at purchasing power parity.	World Bank.
<i>EducSh</i>	School enrollment, primary (% gross)	Gross enrollment ratio is the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the level of education shown. Primary education provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music.	World Bank.
<i>PopDens</i>	Population density (people per sq. km of land area)	Population density is midyear population divided by land area in square kilometers. Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. Land area is a country's total area, excluding area under inland water bodies, national claims to continental shelf, and exclusive economic zones. In most cases the definition of inland water bodies includes major rivers and lakes.	World Bank.
<i>Sani</i>	People using at least basic sanitation services (% of population)	The percentage of people using at least basic sanitation services, that is, improved sanitation facilities that are not shared with other households. This indicator encompasses	World Bank.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
		both people using basic sanitation services as well as those using safely managed sanitation services. Improved sanitation facilities include flush/pour flush to piped sewer systems, septic tanks or pit latrines; ventilated improved pit latrines, composting toilets or pit latrines with slabs.	
<i>Drink</i>	People using at least basic drinking water services (% of population)	The percentage of people using at least basic water services. This indicator encompasses both people using basic water services as well as those using safely managed water services. Basic drinking water services is defined as drinking water from an improved source, provided collection time is not more than 30 minutes for a round trip. Improved water sources include piped water, boreholes or tubewells, protected dug wells, protected springs, and packaged or delivered water.	World Bank.
<i>Tob</i>	Prevalence of current tobacco use (% of adults)	The percentage of the population ages 15 years and over who currently use any tobacco product (smoked and/or smokeless tobacco) on a daily or non-daily basis. Tobacco products include cigarettes, pipes, cigars, cigarillos, waterpipes (hookah, shisha), bidis, kretek, heated tobacco products, and all forms of smokeless (oral and nasal) tobacco. Tobacco products exclude e-cigarettes (which do not contain tobacco), "e-cigars", "e-hookahs", JUUL and "e-pipes". The rates are age-standardized to the WHO Standard Population.	World Bank.
<i>TB</i>	Incidence of tuberculosis (per 100,000 people)	Incidence of tuberculosis is the estimated number of new and relapse tuberculosis cases arising in a given year, expressed as the rate per 100,000 population. All forms of TB are included, including cases in people living with HIV. Estimates for all years are recalculated as new information becomes available and techniques are refined, so they may differ from those published previously.	World Bank.
<i>HIV</i>	Prevalence of HIV, total (% of population ages 15-49)	Prevalence of HIV refers to the percentage of people ages 15-49 who are infected with HIV.	World Bank.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
<b>Macro-level analysis</b>			
Current health expenditure (% of GDP)		Level of current health expenditure expressed as a percentage of GDP. Estimates of current health expenditures include healthcare goods and services consumed during each year. This indicator does not include capital health expenditures such as buildings, machinery, IT and stocks of vaccines for emergency or outbreaks.	World Bank.
Final consumption expenditure (% of GDP)		Final consumption expenditure is the sum of household final consumption expenditure (private consumption) and general government final consumption expenditure (general government consumption).	World Bank.
General government final consumption expenditure (% of GDP)		General government final consumption expenditure includes all government current expenditures for purchases of goods and services (including compensation of employees). It also includes most expenditures on national defense and security, but excludes government military expenditures that are part of government capital formation.	World Bank.
Households and NPISHs final consumption expenditure (% of GDP)		Household final consumption expenditure is the market value of all goods and services, including durable products purchased by households. It excludes purchases of dwellings but includes imputed rent for owner-occupied dwellings. It also includes payments and fees to governments to obtain permits and licenses. Here, household consumption expenditure includes the expenditures of nonprofit institutions serving households, even when reported separately by the country. This item also includes any statistical discrepancy in the use of resources relative to the supply of resources.	World Bank.
Life expectancy at birth, total (years)		Life expectancy at birth indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.	World Bank.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
	GDP per capita, PPP (current international dollars)	This indicator provides per capita values for GDP expressed in current international dollars converted by purchasing power parity (PPP) factor.	World Bank.
<b>OLS and IV regressions</b>			
<i>DEASc</i>	Scores derived from DEA estimations	Estimated input- and output-oriented technical efficiency scores of (i) total and (ii) government health spending using Data Envelopment Analysis	Authors' calculations.
<i>Gini</i>	Gini index	The Gini index measures the extent to which the distribution of income or consumption among individuals or households within an economy deviates from a perfectly equal distribution. A Gini index of 0 represents perfect equality, while an index of 100 implies perfect inequality.	World Bank.
<i>UHC</i>	UHC service coverage index	Coverage index for essential health services (based on tracer interventions that include reproductive, maternal, newborn and child health, infectious diseases, noncommunicable diseases and service capacity and access). It is presented on a scale of 0 to 100.	World Bank.
<i>PopDens</i>	Population density (people per sq. km of land area)	Population density is midyear population divided by land area in square kilometers. Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship--except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. Land area is a country's total area, excluding area under inland water bodies, national claims to continental shelf, and exclusive economic zones. In most cases the definition of inland water bodies includes major rivers and lakes.	World Bank.
<i>EducSh</i>	School enrollment, primary (% gross)	Gross enrollment ratio is the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the level of education shown. Primary education provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music.	World Bank.

**Table A.2** Description and sources of data

Variable	Description	Definition	Source
<i>GovSh</i>	Share of government in total health expenditure	Derived from the ratio of government health expenditure and sum of government and private health expenditures.	Authors' calculations.
<i>ForeignAssist</i>	External health expenditure per capita, PPP (current international dollars)	Current external expenditures on health per capita expressed in international dollars at purchasing power parity. External sources are composed of direct foreign transfers and foreign transfers distributed by government encompassing all financial inflows into the national health system from outside the country.	World Bank.
<i>Debt</i>	Central government debt	Total stock of debt liabilities issued by the central government as a share of GDP.	International Monetary Fund. Global Debt Database. <a href="https://www.imf.org/external/datamapper/datasets/GDD">https://www.imf.org/external/datamapper/datasets/GDD</a> .
<i>GDPpcap</i>	GDP per capita, PPP (current international dollars)	This indicator provides per capita values for GDP expressed in current international dollars converted by PPP factor.	CEIC Data Company. World Bank.

GDP = gross domestic product, PPP = purchasing power parity, UHC = universal health coverage.

Number of observations		93	93	93	83	83	83	

COVID-19 = coronavirus disease, Exp pcap = expenditure per capita, HIV = human immunodeficiency virus, In = natural logarithm, SFA = stochastic frontier analysis, TB = tuberculosis.

Note: Standard errors are in parentheses. \*\*\* significant at 1%, \*\* at 5%, \* at 10%, and <sup>+</sup> at 15%. Table A.2 expounds the description of the variables used in the estimation.

Real GDP per capita ( $t - 2$ )	18,792	20,596	1,156	114,986	20,668	21,382	1,193	114,165
Real GDP per capita ( $t - 3$ )	18,322	20,256	1,144	116,284	20,188	21,064	1,156	114,986
Real GDP per capita ( $t - 4$ )	17,958	19,871	1,124	113,183	19,655	20,713	1,144	116,284

COVID-19 = coronavirus disease, DEA = data envelopment analysis, GDP = gross domestic product, N = number of observations, PPP = purchasing power parity, SD = standard deviation, UHC = universal health coverage.

Notes: The estimations use  $t = 2019$  cross-section data for pre-COVID-19 scenario and  $t = 2020$  cross-section data for mid-COVID-19 scenario.
